

5.1P: In Person Check-in 2 – Answer Sheet

1. What was the most challenging aspect of the drawing tasks? Why?

The bad wording of the instructions making it extremely vague and unhelpful on what it is asking me to do, the bad layout where it shows the UML diagram and then gives a bad explanation of what it is asking and introducing concepts with little explanation of what they are and how to implement them, the confusing pseudocode that is worded very badly

2. Review your answer to question 3 from check-in 1. Did you use any of the strategies you identified? How did they go?

Yes I did and they helped in giving examples and explaining the concepts of C# better than what the tasks have explained

3. What are some strategies for success you can start or continue using for the remainder of the semester?

Using AI to solve technical difficulties and to explain errors in my code and to use it to get a better understanding of why my code is messing up, getting examples and help from outside professionals that use C# professionally

4. Summarize how you utilized Encapsulation, Abstraction, Inheritance, and Polymorphism in your submitted tasks.

I used encapsulation in the different shape classes as the program didn't need to know how to draw the shape it just needed to give the attributes of the shape it wanted and then received the shaped requested, I used Abstraction in the creation of the shapes as all they needed was the start point of the shape aka the mouse and it would change itself depending on the shape selected as all only needed the position of the mouse, I used inheritance in making the "myRectangle", "myLine" and "myCircle" sub-classes of the "Shape" class, and I used Polymorphism with shape and drawing class as all shapes needed both but they would change depending on the shape selected.
